

Bees communicate with each other by dance for example the 'around' dance informs the other bees that a big source of nectar is close to the hive.

The 'turnout' dance informs that nectar is more than 100 metres from the hive, so bees have to fly away for it.

During the flight for nectar, bees visit even several hundred or several thousand flowers.

Honey bee is the only insect that produces something that can be eaten by humans.

Bee bites, often called 'stings', according to scientists relieve the pain associated with arthritis. In many countries there are bees-therapies.

Bee stings make the pain stop for several years.

The brain of bee is oval and has the size of a sesame seed.

During its lifetime, a bee can travel even a distance the earth circumference, so it is as if it fly away around the world.

Honey never goes bad – the scientists proved it.

The oldest honey has above 2 thousand years and the scientists, who found it, sweetened their coffee and tea by it.

Bees hit by their wings about 250 times per second.

Gold and golden color, like a ring on a finger, annoy the bees, because it is like a sun for people – it dazzles them.

Honey bees don't know from the birth how they have to produce the honey. They learn it in the hive from the older bees.

Bees can find flowers thanks to foreheads - they have the smell sense on them.

Honey has been valued for many years and it is considered a medicine.

It works fine on everything and helps with many diseases from a sore throat to heart problems or digestion. It also supports blood flow and prevents pneumonia.
